

# BLUE

WHITE-PAPER

# Introduction

There are more than 10.000 cryptocurrencies in existence, some of them have valid real life valid use cases, others are used to market certain products or ecosystems, but out of these 10.000 cryptocurrencies, none of them provide privacy and support smart contracts at the same time.

Cryptocurrency was first introduced as a decentralized store of value where you are your own bank, but if decentralization comes at the cost of the origins, amounts and destinations of all your transactions being public, then traditional cryptocurrencies will not be suitable for long term adoption.

To solve this issue, it is better to launch a new project rather than perpetually fix existing projects which will require all of the network users to update their clients.

We would like to introduce Blue, a cryptocurrency that is secure, fungible and untraceable.

**By using Blue, your transactions will not be publicly searchable using block explorers, and your wallet address will never be linked to your identity because a new sub-address is generated any time you want to make a transaction, meaning that your Blue wallet can have an infinite amount of addresses.**

**BLUE transactions will be confirmed by distributed consensus and will be immutably recorded on the blockchain, no Third-parties will be needed.**

# Redefined smart contracts

All transactions on the BlueChain, no matter their complication or difficulty, will be subject to the same fixed fee of approximately \$0.05. This model will encourage the use of smart contracts on the Blue ecosystem at any time, even at times of network congestion.

To solve this issue, it is better to launch a new project rather than perpetually fix existing projects which will require all of the network users to update their clients.

We would like to introduce Blue, a cryptocurrency that is secure, fungible and untraceable.

By using Blue, your transactions will not be publicly searchable using block explorers, and your wallet address will never be linked to your identity because a new sub-address is generated any time you want to make a transaction, meaning that your Blue wallet can have an infinite amount of addresses.

**BLUE transactions will be confirmed by distributed consensus and will be immutably recorded on the blockchain, no Third-parties will be needed.**

# Consensus Mechanism

Blue will run on a delegated proof of stake(DPoS) system that will separate the roles of stake holders and validators, this will highly reduce gas fees and the overall environmental impact of Blue.

By using DPoS and requiring transaction validators to have acquire important quantities of \$BLUE, most if not all potential malicious validating groups or users will be prevented and deterred from attempting any malicious activity.

# **BLUE Launch**

**Blue will have 2 launches, an initial launch on the bep20 Binance Smart Chain where we will park until the BlueChain Mainnet launches, users can migrate their tokens from the BSC to EC**

**1:1.**

**We have chosen the Binance Smart Chain because it is the quickest and most cost-efficient blockchain for users to move their funds and interact with smart contracts. As of now, BSC is the leading blockchain in terms of efficiency. The Binance Smart Chain uses a gas model for transaction fees that measure the complexity of a transaction. BSC users can set a gas price according to the network demand. Ethereum is not an option for us since the gas fees are very high.**

# Tokenomics

**BLUE Has a total supply of 1.000.000.000 (1 Billion).**

**5% Of the supply will be allocated to marketing and operations, and another 5% will be dedicated to the BlueChain fund.**

**5 Million Blue will be initially launched on PancakeSwap, with the rest slowly added later so that the price does not get affected.**
